No written works upon the subject of the press as a factor in the development of Kansas agriculture were found by the author in preparing to make this study into Kansas newspapers. So far as has been determined nothing has been written heretofore upon the particular phase of the subject covered by this study. The results are therefore largely pioneer in character, so far as Kansas is concerned.

Helpful ideas were found, however, in "The Development of Agriculture in New Jersey, 1640-1880," by Carl Raymond Woodward (1); and in "Notes on the History of Iowa Hewspapers, 1836-1870" (2). A "History of Kansas Newspapers," (3) by William E. Commelly was an invaluable add in making the study.

#### AGRICULTURE AND THE PRESS BEFORE THE WAR

cultural history of Kansas.

A two-fold purpose caused this study of Kansas newspapers to be mide. It was sought to determine first, the nature and extent of material pertaining to agriculture printed in newspapers of the state between 1854, when Kansas was organized as a territory, and 1900; and second, how this material affected the development of agriculture. In other words-how and to what extent was the press a fector in the development of the state's agriculture during this period.

To ensuer these two major questions, bound files of the Kansas press were referred to in the newspaper library of the Kansas Historical Society in Topeka. To facilitate the study the 46-year period was divided into four rather distinct, well-marked periods, and then considered chronologically and in detail.

No special attention was given to the specialized farm prees in this survey. In fact, since there have been few really successful and long-lived farm papers published in Kansas, they constitute numerically only a minor portion of the publications of the state. In the course of the state's 75 years of existence as a specified territory there have been many publications founded to disseminate chiefly agricultural information. Few of these, however, have managed to survive the early lean years of their sxistence. A survey of the character of these strictly farm papere, looking into the reasons for their being founded, their avowed purposes, their accomplishments, and reasons for their ultimate demise, should make an interesting and comprehensive study in itself. But to make the study more general and all-inclusive the prese as used in this survey refers to those thousands of newspapers of general circulation printed occasionally, interruptedly. spasmodically, or continuously as the case may be during the 54 years covered.

It should be borne in mind that where this study refers to a small number of Kansas papers, hundreds actually were printed. Those papers selected for reference are considered representative of the whole. Seferences, where used verbatin, are opisal with as near the original spelling, punctuation, and typographical arrangement as is constable with this method of reproduction.

#### The Four Periods

First-1884-64-The decade following the organization of Knames as a territory in 1884 stands out like a beason light by virtue of its border worfare during the first five years and the great Civil war during the last five. This was a period or political contraton which pre-cluded any intelligent attention to the agriculture of the sixte. Detween 1864 and five five the standard of the standard of the first provides the press and by word of mouth the universely support the press and by word of mouth the universely support the press and by word of mouth the universely support the press and by word of mouth the universely support the press and by word of mouth the universely support the press and the press of the region.

With the baginning of hostilities between the north and the south, there was noticeable cessation of agricultural activities. As evidence of this it may be pointed out that while the population of Kansas increased 32,975 between 1861 and 1885, only 2,260 cares of time in these four years. (Connelly, History of Kansas, Vol. II.) Lunigrants once to Kansas than not to build home on the fartile prairies but to seve the state for the north.

Second-1864-75--This ll-year period was marked by a rapid efter-the-war development during which the population increased about 588,000. The area under oultivation, however, inarcased de million ceres during the decede. "Perhaps no state or country ever showed such an increase in cultivated land in so short a time," Commelly relates in his History of Kenses. (Commelly Third-1875 to the early '90's-The period stands out for its steady, healthy growth in an earloultural same. During the approximate leyear period prestically all the soverment land was taken up. The state had built its reputation for agricultural and investock production, educational advancement, and favorable, healthy alimate.

Fourth-1890 (approximately) to 1800--Perhaps the fourth period cannot rightly be said to end with the close of the nineteenth century ainer the outstanding feature of these years, agriculties, and the said that the continue of the said of of the sai

#### Kansas' First Paper

In beginning the discussion of the first period a snort reference to the first paper published on Kansas soil will be of interest. The "Kansas Weekly Hereld" was the first newspaper of general circulation over printed and circulated in what is now Kansas. Volume I, No. 1 was printed September 15, 1854 at Leavenworth, K. T., mythically under an elm tree. Trus, its owners, Nm. J. Caborn and Nm. H. Adams, started setting type for it under an elm tree on the banks of the Nissouri river. But before the

paper was printed they moved into a building as this paragraph from the first issue shows:

#### Removed

"Our publication office has been removed from the alm tree on the lavee to our new building on the corner of Levee and Broadway."

These editors of the Kansas Weekly Horeld began publication of their paper not so much in the interests of agriculture as in the interests of polities, more particularly, the interests of the south. They did, however, have more of an idea of the importance of bushendry than one might suppose had one never seen a copy of that first issue of their paper.

In a prospectus the editors did not overlook agriculture, thus:

"We shell----issue a weekly journel devoted to Miscellany, Literature, Agriculture, general intelligence, and the maintenance of Democratic principles."

Also, in the prospectus:

"Ours is peculiarly an agricultural state, and our assummensant will be given to all efforts to promote this branch of the industry, and for the development of agricultural science, so important to the people of Kensas, as a grain growing community." In a long article the editors pletured fances territory as an extremely fertile section adapted to agriculture, aspecially along the Law and its tributaries. They edid in part:

These references, especially that to agricultural science, indicates considerable judgment and probably, too, more than ordinary vision for the future.

A year later (Vol. II, No. 1,--1855) the Berald carried under its name plate this benner: "A Weekly Journal:--Devoted to Southern Principles, Literature, Science, News, Agriculture, and the interests of Knamas." Its editors had not described the soil, this statement of their paper's purpose seems to indicate, and still later (Vol. III, No. 20) they speak of Knamas thus: "Ear fertile soil and sulprious climbs....."

Evidence there is allenty that Kanase' first newspaper continued to give much space to agricultural topics. Let these brief items represent the tone of farm articles and news items: "A Ennes Deet. -- The editor of the Enness Fioneer thus obroiles the dimensions of a best raised and presented to him by a resident of Kickapoo City. It is a whopper: measures 25 inches in circumference, 23½ in length, weight 18½ pounds, of the common blood variety."-- (Kranes Deetly Hereld, Vol. II, No. 1, 1855)

"Our thanks are due to C. W. Southard, for a large turnip, weighing 8 pounds. It was reised on his ferm in this county, on the head of Little Strenger creek. This is but a beginning of what the soil of Kansas will produce...."---[Kansas Wockly Herald, Vol. III, No. 8)

And in the same issue:

"The ear best this? Nr. Thomas Stewart, of this county, left with us 12 Irish potatoes, of his own raising, that weighed 13 pounds! They were of the pink eye, and has (ais) no twigs or branches, but each one was separate, to itself. This is the way Kansas soil produces, and that too, in the first years' cultivation. What will it do, the second or the third? We cannot tell."

This paragraph was followed by enother item which referred to comeone mearby who grow 12 potatoes weighing 12 pounds. A sample of sod eorn was described, of which one ear had 20 rows, 1,000 gratus, and weighed one pound and nine ounces.

These items were edited, opparently, by Lucien J. Sastin, well-known early Kansas editor. The effect of such paragraphs must have been two-fold: First, the local reader must have been snouraged. Seeing was for him, believing. But he was an easterner building a home in the new west. Ofttimes he was lonely, discouraged by hard times—such gloving accounts of the things he eaw daily must certainly have opened his eyes to his opportunities, given him new hope, spurred on old hopes that were dying. Second, copies of and olippings from these early Kansas newspapers filtered through the intervening hundreds or thousands of miles back to the states from whence the fancas settlers had come. It seems legical to conclude each items must have entited more pioneers to the plains of Kansas Territory.

To be sure, much of such meterial printed was of landboom character. On the other hand, mention was made frequently of settlers in dire circumstances, of the hot winds, and later of the pestilences of the grassboppers. Altogether the preices of Kanses' climate and soil outweighed the lamentations of her shortcomings, and since this is a study of the press as a factor in the development of Emmons agriculture, even the innd-boom type of stories must be considered. It must us admitted they got in their work, evidence of which is, excepting the war period, to be found in the record of rapid increase in population of the state.

All the early assumptor articles brugging of the resources of Emass were not strictly about the wenderful crops the new territory could grow. Sometimes the ability of the new territory to produce was implied, sometimes the reports sought to correct mistaken ideas as did the following:

"The opinion generally purvades with strangers that the Territory is not settled more than 40 or 50 miles beek from the Hissouri river, which is erroneous. There are large sattlements 100 miles in the interior, and civilisation is still progressing westward. Already a town has been laid off at the mouth of the Saline Fork of the Kansas river, a distance of over 200 miles from this place, (Leavenowth) and in a country which has been heretofore pronounced a desort, and unadapted to the wants of settlers but the experience of the Kansas pioneer has exploded this false theory, and we may yet see the plains inhabited and brought under the dominion of the weeful arts of wirili-

zation. "-- (Kansas Weskly Herald, Vol. III, No. 20)

In the autumn of 1807 the Mannes weekly Hereld reprinted (Vol. IV, No. 7) a two solumn letter to the Missouri Republican describing the possibilities of Kaness, especially morth of the Kav and up the Blue rivers and the Republican. The correspondent thought the towns of Ogden, Margaville, and Teousseh offered the greatest opportunities for growth at that time.

In the Topekn Tribune (Vol. III, No. 39, spring of 1859) the editors urged citizens of the torm to plant fruit trees, arguing the trees would pay in dellars and sents. They urged people also to plant vines and trees for beauty.

In the following issue (April 7, 1889) the editors-7. F. Cummings and Lorenzo Dow-saked: "Thy do not the farmers bring in their oggs? They seem unusually scarce for this season of the year."

Another sumple of the glowing accounts which sattlers and stockholders in town companies sent back via letters and the press to their friends in eastern states is the following, a reprint from the Kansse Fress (Council Grove, 1859) in the Topaka Tribune of that year (Vol. IV, No. 5):

"We say only what we know to be true, when we say

that the Cottonwood Walley is not only the hands mest but. all things considered, the best part of Kansas. Toursday of last week, we went up the Cottonwood some 12 miles, and was indeed surprised to find so much good country, and it unoccupied. The Valley at the function of Middle and Diamond Springs Creek, with Cottonwood, cannot be beat in Vansas or anywhere else. Hundreds can yet find good claims in this valley. We took dinner with Mrs. Shaft who has one of the best farms in the whole valley. She has just harvested e fine field of whest, and has 50 scres of the best sorn we have seen envelore. "a venture that no other 50 sore field in Kenses can be found to sound it. At Mrs. Shafts, we noticed another curiosity: at least it would be eny other place in Kensas than the Upper Cottonwood. It is a large spring of water. A stream as large as a men's head boils out of a ledge of rock, drops into a basin of solid rock, holding, we should think, a hundred barrels, and them runs off in a besutiful rivulet. It is a delightful spot, and well worth a visit to the Cottonwood."

## Advertising Was Indispensable

As a meens of advertising the public sale of lots in the early Kansas towns the newspapers could not be equalited. In the Zename spekty Servid (fol. I, No. 53) appeared outerlineasts of Lund sales in the following towns: Rebreake City, Nebr.; wamee City, F.T.; Jackson-ville, K.T.; Fort Tillies, T.Y.; and Ct. George, F.T. In addition there were numerous other notices and ennouncements of similar nature. And this was when Kanesa Territory had been so organized and designated for less than a year. Later on the notices were more numerous and appeared in many, many more papers.

If there be any who think early Kanses settlers lecked visions or agricultural development in this stee, let them study the following on "a progressive science." In a letter of column length, to the Topeke Tribune (Oct. 1, 1859) on anonymous writer advocated establishment—in Shammes county and the Territory—of good schools, and closed the article with:

"A few words in relation to your agricultural intereate. This early period of your history as a community, is the time to set your atabas, and establish reles for the protection of your agricultural interests. You have astural advantages equal to any other in the Union, and if the fermers are not successful in their efforts to develop the sealth of the soil, it will be their own fault. Let them, then, commence right, and avoid everything that will militate against their interests. Nothing will prove so injurious to these interests as the importation of poor seed, as well as of miserable puny stock of every description. Let our agriculturists express by their ections, their unqualified disapprobation of such impositions, and accept nothing but the very best, both of seed and stock, -In conclusion, allow me to suggest the immediate organization of an Agricultural and Horticultural society, es the best medium through which to secure the improvements I have mentioned .-- It will be calculated to raise the standard of everything in that line, to ereate e laudable spirit of emplation in every department, and to make farming hore, whet it ought to be--a progressive science. Topeka. Sept. 29th, 1859 Americus"

Eanses wee not without many such far sighted individuals in its early days. But for every "American" there were hundreds of careless, less intelligent fermers. The newspapers to a broad extent helped to equalize this situation insmuch as they gave voice to much community leaders as American and thus broadcast helpful ideas on mushandry. On the contrary the narrow, careless, non-progressive fermer, without this aid, probably secttered his ideas of farming not to thousands through the press but to a hendful of listeners merely by word of mouth.

#### Agricultural Literature Improves

By 1860 Kansas papera were devoting more space to cound agricultural principles, this atual indicates. For example, in addition to the frequent references to the size of products and to enormous riselfs, papera were printing more articles such as the foregoing one by Americas and frequently reprinted longer articles from centern agricultural papera. In an article "Foints of Cows," reprinted by the Topka Tribune (Now. 26, 1869) from the Bural New Yorker, some ideas of a New York dairymann are given. The article deals with the type of animal one should breed and suggests by implication the terms "form" and "function" which are associated closely by breeders today.

In the came issue of the Trivume appeared notes on handling horses, taken from the Michigan Farmer. The week following (December 5, 1859) appeared an article "To Make Cood Butter," taken from the New England Farmer. The directions, though somewhat more complete were about an follows: Skim the milk as soom as it sours. Stir when new oreem is added. Set in cool place. After last cream is

added "go a-visiting" is hours. At mightfull, fill churn sith cold sater--start churning at carly daws. It will soom churm--free from white specke, etc. Add cold water alouly when buttermills starts.

That procedure will make butter for any table, the article claimed.

Another article, oredited to the Country Gentlemen, advised fermore that after September cattle need feed other than only dry pasture grace and that in cold weather they need shelter instead of being allowed to sleep in open fields. Both theories were based on the belief that it was "the opposite of economy, as it is much easier to keep om fat than to put it on."

In the same issue the Tribune editor hanarded the opinion that oorn and hogs would bring a good price the following spring due to a light crop in Missouri and Illinois, and to the heavy immigration and travel through Kansas to the Colorado gold mines.

Altogether, the criticles seem to indicate a greater interest on the part of the public in sound agricultural practices and suggests that the Kansas editor, alert to the state's needs, sought to supply that agricultural information which the Kansas farmors wanted and meeded.

A typical example of the sort of publicity Kansas papers gave to their state in the early days is afforded by a comment from the Topeka Tribune (December 17, 1859). after pointing out advantages of the location of Kansas on the Missouri river -- allowing crops to be sent to the gulf and imports to be brought back by return voyage; rail connections of four days with New York; the strategie location of the Territory as the westernmost outpost on the frontier, allowing sale of supplies to miners, the militia, hunters, and New Mexico-with these advantages and added to them "a soil unsurpassed in fertility, and a alimate as healthful and at the same time as balmy and as mild, as that of Mexico or Lower California," the editor admitted that it would "be seen at a glance that Kansas offers to the farmers, the mechanic, and the trader, (not speculator) inducements never before held out by any state or territory on the continent."

It should be added that at that time Kansas was enjoying September weather in December.

Fust as it is today, agriculture! I tems printed in the early papers mometimes were imprectical, put the emphasis in the wrong phose, or were published prematurely. A comple of a "blind" or imprectical effort to promote the interests of agriculture is the following (Topska Tribume, Vol. V. No. 35, 1861):

"South amprionn Wheat. -- Fin. C. Pickerel has on hand a few bushels of South Amprionn wheat, which he offers for sole. He says it will yield not less than 100 bushels to the acre, and makes a fine artiels of bread. One quart of this wheat will plant an acre. Frozy farmer in the county should have some of this wheat for ceed."

That even an early Kaness editor would believe a single quart of wheat, sowed on an ears, would produce 100 bushels seems impossible. Morever, the paragraph concerning the South American Wheat apparently was published in good faith. It is possible the paragraph was a paid advertisement but the manner in which it was printed does not indicate that it was. The editor's seel to promote agriculture apparently outstripped his good judgment as an agriculture.

#### The Press And The Indians

A point that should be mentioned in a study of this period concerning the relations of the press to agriculture is this: the early kanses papers, apparently without exception, eseminally lambusted the federal government for the inadequate protection settlers were afforded against the Indians.

Overmment officials is shown bands protoction by held forth in a manington, D. C., office and were not alive to the genuine terror in which roving bands of Indians kept people in the outposts of the wastern frontier. Scalping parties were frequent, even messacres were all too common. Fot it seemed to the sattlers that all the protection their federal government nuck was a futile bange in with the Indians for peace—which always meant the Indians were given more guns and more assumition as reward for future peace which was never maintained. With the additional guns and assumition, the Indians were in position again to wage war against the westward marching sattes.

The cerly agriculturies were the case who suffered most hevily at the hands of marading Indians. The farmer and his wife and family, new to the west, sought always to build their home c little beyond the last settler. This put them in a position to be attacked by the Indians. No one was in better position for attack by the Indian than the homestender, barring possibly the cerly stage drivers, who frequently were attacked when far from the outposts of civilization.

#### Editors Brote on Varied Topies

Perhaps enough meterial has been reproduced to give the reader on idea of the type of agricultural literature published by Kaneas newspapers just prior to and during the Civil war but a few short articles, reproduced verbutim, and reference to a number of longer ones will serve to give a broader scope of the meterial used.

Plenting of hedges was a major agricultural topic of discussion with fermors building their homes in Kansas Territory and later in Kansas as a state. The hedges were the cheepest fences that could be built, they provided some shade and fuel, had considerable value in breaking the winds of lavel prairies, and contributed something to the sliteo-meager forests of the state.

In the Topeks Tribume (Vol. Y, No. 36, 1861) there appeared as article on the method of planting Coage Orange hedge. Planting hedge then was as important a problem as planting corn is today, which explains why many other papers dealt with the ambject.

The Topeka Tribuns (Vol. V, No. 40, 1861) gave directions for tarring seed oorn to keep birds and worus from eating it. The gist of the directions: "Soak until hernels are plump, in order to make them germinate quicker. To a gallon of hot water (elmost boiling) add two or three large spoonfuls of tar. Stir well and pour over corn."

The same issue of the Tribune referred to severe drouths in Kansas in the years 1844, 1859, 1854, and 1860. The drouth in 1860 was the worst of the series but two formers woole to the Leavenworth Conservative with highest maps for better crops in 1861. They had faith in Kansas as a cropping state (see above reference) and a reprint from the St. Joseph Gazette also said prospects for abundant fruit and grain crops were excellent.

The Leavementh Deily Conservative (Inn. 28, 1861) in its amnouncement editoriel and statement of clatform declared: "The Press of Kansus has never yet done justice to her agricultural and commercial interests..." and proposed to murd more cerefully those interests.

A number of references to the Kensas Beily Tribune, published of Lawrence in the early sixties will add to the general information concerning agriculture and the early press.

In Vol. I. No. 5, Nov. 29, 1885, appeared this item:
"Antermelon.--Mr. Sands poid us a visit yesterday, bringing
an immone watermelon, almost as good as in summer, with
Mim...."

In the same issue was pristed a persgraph on branding sheep consonically and servicesolly. In Vol. I, No. 12 the Tribune carried a half column article explaining in detail how a Vermonter stored applies successfully through the winter.

Tobeses was once thought to be destined to become one of the staples of Kansas. The Tribune (Dec. 31, 1865) gave this account: "A Mr. Livingston, on the Scoky Hill, recently took a quantity of manufactured tobeses to Junction City, which the Union says is equal to that procured from abroad. Kansas can raise good tobeses." Many times tobeses outlines in Kansas was given space by early papers.

Sometimes the editor played the role of market foreonster. The Daily Tribune of Lawrence (March 5, 1964) furnishes an example of this as follows:

"Plant Corn..-If we might presume to advise our furnere as to their appropriate work, we would say plant all the corn you can this syring. It will pay. It is scarce all over the country, and will bring a big price next season."

And in the following issue:

"Plant Trees .-- Everyone may not be able to purchase a

supply of ormammetal shrubbery from the nurseries, but all are sertainly able to get trees from our native forests to ormament their lots. Plant trees of some kind that will give you and your friends shade to tend to alleviate the woes of our Kensan winds and improve the city."

That susser of 1864 proved to be a dry one by the time August had errived. The editor of the Tribune, John Speer, prominent among early Kansans, shows that he had agronomic sense by the following paragraph which followed enother paragraph discussing the dry weather (Kansans Tribune, Aug. 2. 1864):

"One thing we have noticed, which is that there are some crops raised in Kansas which seem peculiarly adapted to withstend a drouth. Our great escobarine staple, sorghum, is one of these. Cotton, too, is flourishing finely, and, in its thousands of blossoms, gives promise of a most bountiful supply of the flessy fibralis. Sweet potatoes are sending out their vince se though nothing was the matter, and will undoubtedly give a good yield. So, taken all in all, whether we have rain or not we have much to ensourage us."

The foregoing account, published at a time when the worries of war were heavy upon all, indicates the position of leadership-oven sericulturally-of the editors of the

time.

A month later the Pribuse catter (Sept. 7, 1804) printed another encouraging article on the agriculture of Kaness. Following a short article preising the Eaw valley in comparison to agricultural land further east, and with reference to a conking rain of the night before, the Pribuse editor wrote:

"It stands the farmers in hand to put in all the wheat they con, as it will now zrow to a certainty......It is quite well established that winter wheat will do well in this country. It is true that the yield per acre is not as large generally as in some other Western states, etill, sufficient wheat can be raised for our own consumption..."

# News Of Agricultural Pairs

Agriculturel fairs were not frequent during the territorial day of Kansas but a number of expositions showing the agricultural and mechanical products of Kansas were held. If the Freedom's Champion of Atchieon has its records straight the first agricultural fair of the territory took place in Johnson county. The Champion's account of the fair (Nov. 13. 1888):

"First Agricultural Fair in Kansas .-- On the 20th and

Elst ULt., the first agricultured feir ever held in Emmess took place at Nedeminh, Johnson county. The Lawrence Republican says that the exhibition was highly creditable to the county, and a large number of people were present. Premiums were awarded, addresses made, and officers of the scalety for the ensuing year elected. We hope that by mext season we may be able to chronicle a like event in Atchison county."

The sould deay that rending of the foregoing article and sitular ones would have a strong tendency to encourage business men and formers in other sections to foster a childre agricultural fair? There is evidence in abundance that it did, for the county agricultural fairs continued to increase in mumbers and in size through the years that followed. Always the Kennan papers were more than willing to print the news concerning the fairs. Obviously, they would be, since the fuire created their chief cownoid ty-mess. But the address went further than merely printing news. They wrote editorials promoting fairs, printed column after column of prontums offered or awarded, and worked personally outside their offices in the interests of the fairs. That phase of the subject will be touched again later in a discussion of the portod following the Civil wer.

The Lawrence Republican (Nov. 4, 1858) also reported

this agricultural fair in Knama. Its record result in part: "The meet cattle, horses, and vegetables on exhibition were of very superior quality, and would have reflected credit on any of the old States." A partial list of presiums and winners was given.

#### Dependable Advertising delped

Brief mention should be made again of advertising uncter and of its offcot on the agriculture of the state. This agricultural item in the Freedom's Champion (Feb. 27, 1839) leads into the subject:

"Fruit Trees.—The season is approaching when all who wish to set out orehards should supply themselves with fruit trees. Mr. W. L. Caylord, at the Graves place, two and a helf miles from Atchinom, has a large variety of all descriptions of young fruit trees, and all who wish them can be accommented. See Advertigaments."

In the edwartinement Gaylord listed for sale on or ofter March 1, the following: "101,000 one year old apple trees from graft; 10,000 large and thrifty apple trees for forth; 2,000 English cherries; 500 Standard and Dearf peer; 1,000 fine and large peech; also a quantity of grapes; currents; gooseborrys; resoborry; Ormanestal trees; Shrub rose; plants for Hedges, etc."

This edvortisement is adjustional because, size it appeared in one of the territorial papers of the state, it suggests that the press as a force in dissendenting information as paid advartising dates back to the beginning. Other edvartisements were of hardware, clothing, real extete, and general mechandise, such as it is today. There was a large advertisement of stowns makes a suit about 2 by 6½ inches of a store. Farmers are influenced today by the information they read in repers and mechanics, and so long as it is constructive, reliable information it will promote the good of the industry. Just so, 70 years are, the good of egiculture was promoted by the sublication of dependance advertisements such as those referred to here been.

#### An Marly Agricultural Column

Some detailed attention to the first issue of the Lempence Republican will not be anise. It was here (Vol. 1, No. 1, Nay 28, 1859) that the first egriculturel column was discovered in the present study. It is doubtful if any strictly egricultural column preceded that of the Rapublican in Kansas. If it did, the column was not discovered

in this project.

The Republican was edited by T. Owight Theteber and Morman Allen. It made an auspicious start agriculturally with the farmers' column in the first issue and continued more or less regularly with it. The column was headed "Agricultural" and signad by X.Y.Z. Considerable space—about 500 words—mus devoted to the need and uses of hedges in Kanness. Siberian Crab, Honey Locust, and Owage Orange were three varieties discussed, their good and weak points made plain, chiefly from the standpoint of their sattability for fences.

Other items in the column wore: 150 words on unking homeumde soap, directions for planting lime became (this was timely), treating garden plants against susumber bugs, "Boof or Pork Pickle," coffee unking, Indian bread, and toothache remedy. It will be noted that at least helf these items are devoted to that which fell within the planeer housewife's realn in the home. Other papers tended to neglect the home in the early years.

The most issue of the Depublican excited a half column article on the time of planting, method of tilling, and other phases of corn production. The agricultural column under date of June 11, 1857 was constituted of a story of the "clower Panily," skitch pointed out many alovesly methods of farming. In the following issue (June 18, 1867) L.Y.Z. wrote about 600 words on breaking prairie, concluding the critical thus:

"Prairie should be broke at least four inches deep.
It rots better and incurse a better crop than when plowed
more shallow, and makes it much easier plowing the second
time. For this year's crop, lap and sod flat, otherwise
it dries up. For winter wheat, most farmers like to kink
it a little, as it harrows up better. X.Y.Z."

Other agriculturel topics covered by X.Y.Z. in succeeding issues of the Republican were:

"Baising Vegetables," "Growth and Management of Hedges, "Haring," Barly Flenting," "Tobacco Norms," "Building Clay Houses," "Cutting Grain," and "State Agriquiturn! Society."

That subject of the "State Agricultural Society" must be taken up in detail later.

The editor of the Lawrence Republican's agricultural department continued his chets with farmers. They dealt with a variety of subject in one issue (Aug. 27, 1857) his two and a helf columns were devoted to: First, a "talk with the reader" about being a thinking farmer and

thereby putting solence late the forming operations; Second, to "Finter Whest"--how to prepare the seedbed, how to plant, the variety to plant, how to avoid winter Hilling, and minlor angles of wheat forming.

Cortainly the writer of that ferm solumn, in the absence of scores of the modern means of advocating better ferming, was a real factor for good in the development of Kansas agriculture.

A year later, in August 1858, a change of ownership of the Republican was made. Morman Allon, founder of the paper, turned over its reins to T. Dwight Thatcher, who since its inception in May, 1857, had borne the principal editorial burdens of the paper. Associated with T. Dwight Thatcher was his brother, Solon O. Thatcher.

In their prospectus they devoted their attentions enlefly to the manner in which they would champion opposition to human minvery—that bone of contention that was soon to throw the nation into turnoil for a half a decade. However, in the next issue (Aug. 10, 1888) they printed a comprehensive statement, headed "To Farmers," which is both interesting and indicative of the influence they as editors had on Enness agriculture. Their statement:

"To Farmers-We intend hereafter to devote a liberal

portion of the Republican to the interests of Agriculture, and shall be happy to receive practical suggestions and communications from our farmers. We shall never attain to real and parmonent prosperity in Kansas until we raise at least all of our own provisions. Probably during the last year the inhabitants of this Territory paid more than five hundred thousand dollars, in eash, for provisions -- wheat, corn, meat, potatoes, fruits, etc., etc., all of which can be grown at home. We shall not new out nearly as smah this year. Probably there will be quite a large surplus of corn, about half a supply of wheat, and a small surplus of potatoss, We shall pay out a great deal of money this year for poor, miserable, good-for-nothing butter, t a high price, when se might manufacture, right here at home every pound of butter we eat, of an excellent quality, and at a reasonable price. Indeed, Kansas might soon export a large amount of butter every year. We shall pay out a great deal of money to Missouri for fruit. This we can and ought to raise ourselves. No man should think of living on a farm or lot for a single year, without planting some fruit trees. Let them be growing.

"But we cannot talk more on this subject this week.

Farmers: if you have anything to say which would be of interest to your brother farmers, let us have it. Give us your experience."

Let that statement speak for itself! It is sufficient to say that the Republican's agricultural department continued with frequent contributions from Kansac ferments, and those of other states as well. Surely such items and articles, appearing in the Republican and in other Territorial papers had a profound effect on the agriculture of the state, and were no small fector in its advancement.

### AGRICULTURE AND THE PRESS AFTER THE WAR

The foregoing statements are representative of the agricultural material published by Emmses papers in the state's territorial days and during the Civil war. There seems to have been a perceptable shortage of such material during the period of hostilities between North and South just prior to and during the war. However, there was much agricultural miscellany printed for the simple reason that the newspapers continued to be printed, regardless of the warring factions, and the editore' job them, as always was to fill the paper with type. If the agricultural items were not written by the editor about a bumper crop grown

up "sandy "follor" then they were gut to likely coguired by the datterous use of soi more on one or more of the agricultural periodicals of the eastern attice. Hany, if not quite as many, articles as were printed before the war, continued to find their way into the newspapers of Kansas.

We now may take up some of the agricultural developments of the after-war period and the menner in which the press dealt with them.

#### Early State Agricultural Fairs

One of these developments was the growth of interest in agricultural fairs. The second annual "Fair of the Kanness Agricultural end Mechanical Association" occurred at Lesvemorth in September, 1867. Accounts of the fair were printed in the Leavenworth Conservative for several days before, during, and after the exposition (Sept. 18, 1867, and succeeding issues). One to two columns were devoted to discussion of the fair in a news way, editoriale commented on its menegoment and progress, and names of minarer in the many classes were printed.

By reproducing the names of winners in the livestock, horticulturel, and educational events, the papers of eastern Kansas must have erected stimuli to those making entries. They stimulated a greater interest in finer livestock, better fruits, and higher ideals in education.

The feir was sponsored by the county of Lectenworth.

A short item in the Daily Conservative gives an idea of
the feir program for the first day:

"The Fair Today -- The first day of the Fair will sitness some of the most important as well as interesting exhibitions of the season, and we learn that a large number of contestants for each premium have been entered. The following is the programme of today:

10 a.m. -- The trial of draft horses will take place, to be followed by the award of premiums for all draft animals. (The trial was a pulling contest)

12 m .- Work oxen, steers and calves.

2 p.n. -- The examination and award of premiums for jacks, jennets, and mulos.

4 p.m. -- Trial of speed for running horses, mile heats.

E p.m. -- Examinations will take place in specimens of Botany, Geology, and Matural History."

The Daily Conservative parried each day the winners of the previous day's contests, and the scheduled program for the day at hand.

Exhibits of Curaiture, riding vehicles, sewing, painting, stoves, and numerous other articles, had a place in the feir, accounts in the Conservative show. This fast indicates also that the feir was broad enough in its scope that it did not merrow down to only agrigational toutes but took in allied subjects.

Two comments by the reporter are of interest from our viewpoint (Leavenworth Deily Conservative, Vol. XV, So. 68):

"For best fest cettle, The Armsteed, of Creeshopper Falls, Jefferson county took all the premiums, having brought upon the ground three actile that could not be best. Their aggregate weight is 7,280 pounds, and one of them weighs 2,600. That Kenses is one of the best stock states in the country has never been disputed, but we never expected to see the equal of the cettle displayed by Fr. Armsteed." And from the sense column:

"J. F. Legate, Thos. Campbell and others have on exhibition some creditable samples of jellies made from Ennacs fruits; apples, pesches, plums, pears, grapes, and every variety of fruits reised in this latitude can be found in profusion, and should be seen by those silly persons who essert that this is not a fruit growing state." and this reprint:

"Thall Corm. -- The fold (Allen Co.) Courant cays: "Mr. Imps, living at Genova, last week took from his field three stalks of corn measuring respectively, 16 feet, 5 inches, and 17 feet and 7. He informs us that his whole field will average 15 feet or more. Think of it! A stalk of corn measuring 17 feet, 7 inches in length. Who can best it?"

Kaness pioneers never got over this land-boom spirit until the frontier had pessed well beyond them. By the time counties in the central mestern part of the state began to develop, the editors there took up the "tell corm" oudgel while the editors of the contermost counties settled down to a more sombre accounting of the possibilities of Kaness.

However, items such as these just given must have fired the interest of those who, not yet in Ennes, chanced to read them. And they must have been encouraging to those farming pioneers already sinning their homes in the Sunflower state.

Papers of this period continued to make prominent mention of the fight against Indian outrages against settlers. The press urged the government to provide greator protoction against the redesine who attended most frequently the isolated faror. The editors were bitter towerd and had little sympathy for the Indiana. They flayed repeatedly the federal government's leniency in dealing with the atrocious actives.

## The Press And The Railroads

How the railroads cooperated in promoting the fair and how the papers helped out as always by printing news and advertising concorning the fair may be seen from the following article taken from the Manhatten Independent (Sept. 21, 1867):

"State Pair--- assongers Half Fare, Stock Free-- The Gen'l Sapt., Anderson, writes as follows: "The U.P.A.R. Company will transport persons to the Kansas State Fair on excursion tickets, one-half fare. Tickets, good from Sept. 23 to 28, inclusive. Livestock and articles for exmitition will be transported free, when certified that they have not changed sympose."

The agricultural and mechanical fairs, the county agricultural and horticultural societies, and the state agricultural society which later because the present Glate Board of Agriculture are closely associated together. How the county scaleties were made up of township groups may be seen by reference to the Troy heporter (Jan. 3, 1867):

Farmers and machanics of Centre towashly met to organize a township fermers and machanics club. An account of the meeting is recorded in this issue of the Reportor. The township meeting, according to the editor, was a preliminary movement to organization of a county egricultural society. Meahington township slow man argumized, and the same locue of the Reporter records the parameter organization of the Contyham County Agricultural Society. The association was incorporated at \$5,000 capital stock, each share of capital stock worth \$5. The editor of the Reporter urged editorically the formation of the society.

It has been previously noted that the Levenworth Conservative promised to give more attention to agriculture and commerce of the atate-two brunches of industry which the Conservative editors thought had been neglected by too much attention to politics. In the years that Collowed this promise, which was made in the first issue (Jan. 28, 1861), the Conservative did give much space to agricultural subjects.

As would be expected, the material printed was largely of the type that boomed the resources of Kansas. That seems now to have been insufficient. Them companies were formed by the hundreds in those early days, a Despere was one of the first business westures on the town sites, and if the councily didn't "boom" everyone there went broke. The best way to make it boom was to have the local paper print column after column of "bot shot publicity" concerning the resources of its marrounding territory.

After a town once was established, the boom propagands was given in behalf of the entire state as well as for the town. With Levenworth one of the gateways to the new Sunflower state, and well established at that, Levenworth papers could then afford to promote the interests of all Kanson-which they did.

The Conservative reprinted (July 5, 1867) an account from the Emporia News of a Welsah fermor mear amporia who purchased a farm and in one grain arop raised sough to pay for the farm and buy a breaker plow. With this plow he carmed \$500 breaking prairie, them sold it for within \$5 of what he had neid for the implement.

Another Igon county former sold a 280 sore farm for 1,000. This was in the Cottonwood Valley. The Conservative printed these accounts and similar ones to about what could be done with Kensas land and good management. A Salina correspondent to the Conservative sent an interesting account of possibilities in that section (Leavenworth Conservative, July 4, 1867):

"During the last spring, Salins county received a large inadgration; and, fortunetaly, of a class that will one day make it one of the best producing counties in the state. They have settled on the rich bottoms of the Saline and Smaky Hill rivers, and went to work with a will to open up ferus and turn the so-called desert into a garden."

### marly Crop Reports

Approachting that its readers wented mose of markets and erop conditions in other sections the Conservative orinted (July 4, 1867 and other issues of the time) market reports from New York, St. Louis, Chicago, and other sities. It provided also a crops column with brief reports of conditions in such widely separated sections as Illinois, Iowa, Wisconsin, Missouri, Missouri, and the southern states.

There are frequent reforements in the files of the Conservative (Sept. 17, 1867 and other issues of the time) to the Texas to Abilene eattle trade. That Kannas editors were quiek to grasp an opportunity to help the eattle trade in the state, let this item (Conservative, Sapt. 18, 1867) testify:

"An Illamois Corear owning of farm of 17,000 earse, has started an egent to Kansas to buy a thousand head of cattle to stock his farm. Several other entite buyers are also coming to purchase heavy lots here and in the Indian country. The great demand for cattle in Illimois will have a tendency to advance prices here, as they look to Kenses principally for their supply. So says the Lawrence Tribuse."

### Suggestions for Home Improvement

A benefit of no small proportions to Fennes formers has been given by editors of the Emness press, both general and strictly agricultural, by the pointing out of many, many potential improvements which the former could make to the profit and happiness of himself and his family. Oftentimes the former has been too close to his own problems to appredict their significance.

An example of this sort of editorial assistance to the fermer is sensed in a portion of a longer erticle in the Kenses Fermer (Nov. 1865) on improving ferm homes:

"Now that the more pressing duties of the farmer.....

are over, there will be an opportunity of turning attention to the.....matters of prepring.....a pleasant home for the family." Then followed a two column article encouraging rural dwellers to beautify their homes as much as possible-which of necessity were all too often percend unprotected on the lonely, bleak prairie. Fences about the house, shrubs and flowers, vegetable gardens, and einlar improvements were suggested—the things pioneer farmers were frequently failing to provide for wiwe and children in the cerious business of providing food, shelter, clothing, and other bare necessities.

The dream of the writer of the foregoing article has long ago some true, with the gradual fuffillment of his timely advice. It may be noticed there was no mention of adding conveniences to the household for the farm wife's work or to make the dwelling more pleasant within. That step of advancement was to come later.

And it did! In the very next number (December, 1865) of the Kansas Farmer was the following:

Tisks Furm Life Attractive—By adorming the home.
Nothing is lost by a pleasant home. Books, papers,
pistures, music and reading should all be brought to
beer upon the indoor fundly entertainments; and meatness

The article was preachy, distatorial, to be sure, but a hint of what was confing can be seen there. It was a long stride from that little article, printed in 1565, to the magnines devoted exclusively to the problems of the farm woman's home today. Moreover, the advancement has been negotiated by millions of short steps not unlike the one described here.

### The Manhattan Papers

Among early Kansas newspapers devoting much space to general agricultural meterial were the Manhettan Independent and the Manhettan Standard. In the Independent (Sept. 7, 1867) there appeared numerous agricultural paragrephs, discounsing: erops in west Riley and east Clay counties (soon there had suffered drouth which had not been noticed so much around Manhettan), an excellent peach crop, grasshoppers that had passed down the Republican valley, and this boom paragraph: "The Republican Valley presents, at this time, we think, the greatest indicements to Emigration (sic) of any portion of Kansas, the inhabitants are anxiously assiting the advent of the Smil Road which they are sure to have e're long."

In the Independent (Sept. 21, 1887) were items from the Farmers Avertieor, discussing: the best time to prume apple and pear trees and how to bake apples. In the same issue in the local column this item was found:

"Plenting in the Purrow. -- hr. %. Marlett showed us a field of ourn this week which has not been in the least affected by the drought. The stelks are even now quite groon while other fields in the vicinity are dry as husks. The difference is attributable only to the fact that Mr. W. planted it by plowing in. This is worth remembering, especially for those who cultivate the high lands."

The Independent (Vol. V. 1887) frequently clipped with credit form articles from castern newspapers and form magnines. Examples of the articles, found by thumbing through seweral numbers of the Independent, here these various titles: winter management of hogs, sheep rack, ours of mileh cows, ago of sheep, ours of garget, training animals, whitewashing trees, the Goodrich potatoss, and Japan or Chilcun maise. In feet, the Independent printed such week several farm criticles.

True, they were chiefly reprints but were most certainly eagerly read by those pioneer ferming people who were to profit, in many cases, by the reading.

A "Farm and Household" column, appearing in the Independent (Jan. 18, 1868) included a down team, long and short, on agricultural miscellany. The paper carried also complete market reports on lumber, provisions, and grein in all issues.

In the first quarter century of Kansas' existence as either a territory or a state the farmers themselves were the principal advocates of agricultural practices. Experience taught the nest observing and scientific-minded husbandmen many things—that sort of information learned today in the agricultural experiment stations' laboratories. Hence, now ideas in the early days originated oniefly with farmers themselves. The question was: how could the idea or proven superior practice be disseminated to the less observing but squally interpsted farmers?

### The Press A Vital Factor

This study electly shows that one of the most vitel factors in broadcasting farming ideas was the general news press, and in a later period, the agricultural press, in addition. It is true, county formers' clubs and the Ennes State Agricultural Society were importent fastors in exchange of useful ideas in the arts of husbandry. Those farmers who attended the state society meetings in 1862 and subsequent years, heard valuable discussions of timely farm subjects and problems. But what of the far greater number of farmers who stayed at home? Some information would and no doubt did trickle back to the stay-at-home farmer. However, in the final analysis, it was the general newspaper which, plying its way into the thousends of households on Kanses homestends, offered the greatest and curest method of what newspapermen now call "coverage."

As en example of this theory, consider the following story reprinted from the Lewrence Journal in 1868. It is a sample of hundreds or thousands of criticles besed on experiences of farmers and passed on for their worth by a pioneer editor, anxious not only for "copy," but to contribute to the upbuilding of the state's chief industry, agriculture. The Journal story, reprinted in the Manhuttan Independent (Aug. 1, 1868):

"Now to make theat in Kansa--Mr. E. Poole, of the firm of S. & E. Poole, has laid on our table a handful of winter wheat of this year's growth, the stalks of which will average 16 inches in length. He informs us that this is a sample of over 100 acres growing on their ferm at the present time.

"The Mesors. Foole are smong the most smesosaful wheat growers in Douglas county, and their method of oul-tivating this most important and profitable evop is worth the attention of farsers throughout the attention of farsers are unfiliable; opponents of the prevalent western notion that prairie sod should be plowed shallow. They do not believe in it either for eors or wheat.—Some of their best stops of wheat have been raised upon rwe prairie, broken for the first time. Their plan is to plow deep, turning the sod five to eight inches under.

"Then they harrow thoroughly, with a sharp harrow, sharpening the teeth as often as they get dull, until a fine, deep bed of mellow soil on top of the sod is secured.

"They put in the wheat with drills.

"The preciseal method of tillege is, that the wheat does not winter kill, the roots become firmly and deeply established in the fall, and thus able to withstand the dry weather of winter and heavy frosts of the spring. The yield runs up from 30 to 37 bushels to the core, and the

quality of the wheat is most excellent -- often making 47 pounds of flour to the bushel.

"Now this is the kind of farming that Kansas needs. We ought to have 500 just such wheat growers as the rooles in Douglas county alone. If such were the case we should not be sending tens of thousands of dollers out of the state to Missouri and Illinois for flour. Mansas is one of the best wheat growing states in the Union. We only need the proper ethonion paid to this crop, and we might be exporting it to a large extent every year.—
[Augments Journal.]

Now this article was first printed in the Lawrence Journal, then reprinted in the Manhattan Independent, and possibly and probably in others of the 50 weeklies end the 10 dailies printed in Kansas at that time. This gives one an idea of how potent an article it was in the farmers' behalf. Other articles of that kind were benalled similarly.

A full-column article oppeared in the Manhattan Independent (Aug. 30, 1888) on the subject of fall plowing. It was a reprint from Prairie Farmer, smalyzing the reasons why fall plowing was thought best. The reasons advanced compore favorably with reasons given by agronomists today.

Shortly after the consolidation in September of the Manhattan Independent and the Kanasa Radioal the paper was changed to the Manhattan Standard. The editor under the heading "Agricultural and Nortfoultural" said (Sept. 25, 1868):

"We shall keep up as full a department under this hand as possible, and invite our friends-farmers, gar-deners, fruit growers, to contribute the records of their experience for the benefit of the public. New. R. D. Perfor has sent us a few notes for this issue."

A week later (Oct. 3, 1868) the following settrical comment, containing some wholesome, veiled advice, was printed:

"A Grack in the Hog Trough-- A few days ago a friend sont me word that every day ho gave nearly 20 pails of buttermilk to a lot of 'shotes,' and they seareely improved at all. Thinks I, this is a breed of hogs worth seeing. They must be of the sheet from kind. So I called on him, heard him repeat the nouraful story, and then wimited the sty. In order to get a better view of the mireculous swine, I went into the pen, and on close examination found a cruck in the trough, through which most of

the contents ran away under the floor. Thinks I, here is the type of failure of our agricultural brethern.

"Then I see a farmer conditing all the improvements becomes of a little cost, selling all his farm stock to buy benk or relirond stock, or mortgage stock, robbing his land, while in reality he is also robbing himself and his heire, thinks I, my friend you have a creak in your lagg-trough.

"then I see o farmor subscribing for half a dosen political and miscellaneous papers, and spending all his leisure time in reading them, while he don't (sic) read a single aggicultural or horticultural journal, thinks I to syself, poor man, you have got a large and wide crack in your host trough.

"Then I see a farmer attending all the political concentions, and coming down liberally with the 'dust' on all caucus conventions, and knowing every man in town that votes his ticket, and yet to save his meck, couldn't tall who is President of his County Agricultural Society, or where the fair was held hast year, I 'unaminously' come to the conclusion that the poor soul has a creek in his hogtrouch.

"When I see a farmer buying guano, but wasting ashes and hen manure, trying all sorts of experiments except intelligent hard work and souncey, ceiting the choicest of seeds regardless of cost and planting them regardless of cultivation, growing the kind of fruit called 'sour tart seedling,' and sweetening it with segar, pound for pound, keeping the front fields rich while the back lots are growing up with thistles, briars, and elders, contributing to the Choctaw Indian fund and never giving a cent to any agricultural society; such a man, I will give a written guarantee, has got a orack in his hog-trough, and in his head also.—Exchange."

# AGRICULTURE AND THE PRESS FROM 1870 TO 1890

There is a wealth of material concerning agriculture available in all Kansas newspapers during this period. This was the time of great agricultural development in the state. Following the war into the early seventies there same a period of approximately ten years in which the area of land under cultivation increased 4% million acres. This decade was a period of after-the-war rush to a new free land. It was followed then by a more soher, healthy growth of the state's agriculture.

Emmrons trends are obvious in the period. The histories finds the ometer of population pushing further restoard in the state. Mewspapers in towns in the central section of the state—from east to west—seem to supplement if not to substitute for publications earlier found in the eastern section of the commonwealth. By the end of the period newspapers as far west as Dodge City were thriring in bushing communities of which Dodge City probably was tyndeel.

These two decedes provided the agriculturally inclined editor ample reason and opportunity to use his penflore was the farmer-labor movement of 1875, the Granger movement throughout much of the period, Greenbeckiem of the early eighties, Formers' Alliances of the same decede, and with the steady extension of agricultural activity further westward this new territory was going through the same pioneer period through which the easternmost perts of the state had gome a quarter century before.

## The Beginning Of The Farm Column

Noticeable in a study of this peried is a strong tendeacy for newspapers to assemble agricultural metrical into a "ferm column." Early editors usually gave the column a label bending such as "Farm Notes" or "Agricultural." Within this period (1870-90) papers used more and more the daily market reports.

One of the best of the early farm columns was that

conducted by Wr. W. Warlatt of Glesmont Form, in the Manhatten Secon. In the first instalment of the department (March 28, 1872, Vol. I, No. 8) Wr. Marlatt devoted one article of more than a column in length to the art of planting fruit trees, reprinted another on "Sweet Potato Culture," and another on covering materials.

Marlatt's column continued weekly, discussing subjects such as the following, chosen at rendem: Will It Pay to Sell Corn?, Malch and Manure, Don't Fire the Prairies, A Flee for Boys on the Farm, Weeds, Cooperation. These subjects and especially their valueble content suggest that forward-looking farmers of the time were not infortor to present-day farmers in their ideas of scientific agriculture. Marlatt we a close observer and a fluent writer--who would argue that his articles were not an important factor in the development of agriculture in Riley county and surrounding communities?

The thoughtful farmers, largely substituting them for the agricultural experiment stations of today, furnished the farm experiences and their analyses of them, while the early-day editors provided means of dissominating the visdom sequired through experience and closs study.

The Merysville Signal (Vol. I, No. 2, Sept. 8, 1881, and subsequent issues) carried a column of "Farm Notes" and

Thousahold Helps. The autorial in those columns gives some indication of being what newspapermen boday cell "canned-stuff" or resdy-made copy sourced from a newspaper syndicate. Mevartheless these two features contined much agricultural miscellany, as the following subjects, each of which was discussed briefly in one issue, indicate: specific gravity of oream, hard used in cheese making, consumption of poultry products in the United maters, remissing longs on pasture, insects—the wheet midge, fattening cattle, sheep production, easter oil better than lard for greasing iron sales, nutritive matter in by and sorm, stilled and stable habor needed for agriculture, good funding—saving fertility—menuring, concentrated feeds—cottonseed and linesed cake, picking fruit, fowls in orehards, ensilage—controversial results.

while many newspaper editors of today prefer to motish agricultural material throughout the pages of their papers rather than in a column or department to itself, the placing of ferm notes in a column or department in Kansas papers of the seventics and eightics had a different significance. It means recognition for exciculture. That recognition by general newspapers, plue the sateblishment of distinct form papers, (Kansas Furmer, Camp's Amigrant's Guide, pirit of Lances, couthern Kansas Ismigrant, and others; constituted the greatest ispetus the press could give to agriculture of the state.

# Press Urged Improved Methods

of interest is she flot that the "Farm Notes" author (Maryawinia diguma) wrote repeatedly of conservation of soil fortility. Today, a half centur; later, agriculture is buttling the same problems of soil fortility. But now farmers are facing the shorteges which this writer production.

A typical agricultural item of the times is this from the Ford County Clobe (Feb. 24, 1880):

"Mr. .. J. A. thony returned Lost Thursday overlag from his trip to Sougemen county where he made the purchase of a fine thoroughbred calf, ten nonths old, which weighe 670 pounds. A. J. has a great filing for thoroughbred stock, and is constantly adding to his hard. This is a step in the right direction and we hope other cattle men will follow suit."

The Clobe cerried a weekly market report giving prices of cattle, mogs, grain, general produce and horses and males. It also printed an immense amount of news pertering to the Towns-to-Kewsen outlie trade of the eighties.
Dodge City then was the porthorn and of the long trait from
the Lone Ster country. In the surmer of 1885, 300,000
eattle were driven into that artic buying outloost-(Kansas

Comboy).

Like other mapers referred to, the Globe gave much space to iscall means cardellural topics, including a signed item from "Gromegor" (April 5, 1981). During a live-stock sents convection in Dodge City, april 10-15, 1885, the Clobe printed & Saily edition called the Dodge City Delly Alabe, giving proceedings of the convention and other maps.

The Coborne County Former was another weekly paper to give much ettention to the husbandry of the times. In its issue of Jacoury 9, 1879, appeared discussions of farm toutes as follows:

coles heeded "agricults." with a mote to the render that "ell communications intended for this department should be edirected to 0. B. Thrwell, Corinth, Geberne County, Ken."--the column conteined hints and suggestions for sheltering cattle in winten, a reprint on reising sheep, and a long reprint "How to Teed for Eggs;" what appeared to be a ready-print organization is seeling.

dy rement of teo-only in langth; a restrict from the reason Hommstood on the possibilities of kenses as a stock relate country; as ritiols arguing that males re superior to horses for farm work; reprint on the value of cobseal for feeding milk costs; and a percyrch about a Mr. Cochren who lost 150 heed of last year's lambs by crowding during a cold spell-others who sheltered their about corefully had no losses.

Conditions in the eightics were not such that firewere coriously meeded timely holps nor emert of the on production methods. With a fertile soil and enfficient reinfall frames produced abundantly. Their problem was to disjons at profitable figures the abundant crops. Fuch was printed about prices of agricultural products and addinger and capitalists who robbed the farmers. These subjects are treated later. However, in its handling of nowe—Kaneas aditors have always attracted the idea that they print NEWENDEPERS.—the press overlooked no opportunity to chronicle news of an agricultural meeting or event. Javance stories, timely stories, and followup stories on meetings and the lite were on the regular schedule of the reporter.

Editor F. H. Bernhart of the Osborne County Farmer apparently was not one of many newspaper writers who went

to storm in that their reservice exemities as it and locations for the form on the stical homes. He printed (N. 18, 1866) a very on the time of the second strains of the second strains to the second strains the second strains of the second second strains of the second s

"The prolumni "these ow i, who to be done

There is just now a nort of forling of uncentions cannot got fervers, as though an unch corn we are no lephont on their hale. Case people on 't bear consisty. ## Too Much Manapaper Publicity

Nowapar persons are accustomed to being accused of frequent mistakes and it would be a mistake to point out mome of their apparent shortcomings in much a study as this. The Prisco Pioneer, once published in Kanasa county, Later Morton county, in the hustling little center of Prisco, affords an axample of a newspaper which may not only have failed to advance agricultural interests of its community but may have hindered the same condiderably.

No ridicule for look of affort to promote industries of Frisco could be made against the Piomeer editor. The fault lay rather is overplaying the possibilities and the resources of the community. Frisco citizens, numbering a dozen or so when the Pioneer was established, fought a waliant county-seat fight with two maighboring towns and lost, but while its boom days were on, Emphrates Boucher, Pioneer editor, gave to the world one of the hottest little boom town papers that Kaness ever may.

Some references will convey the tone of his writings (Vol. I. No. 1, Jan. 8, 1886 of the Piomeer):

"Capitalists desiring to invest where they are eartein of two hundred per cant profit in six months should

65

invost in Frisco." And then followed a full column of supercharged publicity in behalf of the new town which then needed only "a good dry goods, elothing, furniture, and boot and shoe store."

"The climate of Kansan is as wonderful as the great prosperity that has blessed its people," the Ficeneer editor continued. "Today it is stormy and cold enough to drive you med; toworrow the calm, gental and belay atmosphere costs sweet and loving kisses in your face; today it rains in torrents as if it never could stop; tomorrow the clouds are gone and the sun's gentle rays make you length with pleasure; today there is portial want, short crops; tomorrow her lap is filled so bounteously full of everything that the husbandmen know not what to do with his products and money flows into her coffers like streams of Ophir and all is joy. Such is Kansans."

Though the Flower editor did not always keep his antecedents straight, he was a first-class press agent. Page 1 of that first issue was about Frisco and mothing size and was reproduced in subsequent issues with only slight and timely revision. Agriculture was not over-looked. A column and a half was devoted to "Stock and Farming," calculated to enhance the reputation of the community agriculturally.

Enses county we pictured (issue of Jan. 20, 1886) thus: "no better country in the world for wheet, corm, cats, potatoes, clover, and sorghum." Fruit was also thought to do well. However, only six months later (July 21, 1886) with corn still looking fire, the Pioneer declared: "While Colorado leads the world in the largest hailstones, weighing from four to eight pounds: southwest Enness leads in the finest fruits of general varieties and species, the tallest and best corn, the largest beets, orbhors, rotatoes, Irish and sweet and all other cross."

In the short period of eix months the county had passed through its period of speculation, if the Pioneer account is to be interpreted literally, and had become definitely adapted to the culture of fruit, corn, and regatables.

The instance of the Frizor Floner is cited as evidence in a belief that some harm may have been done by too much land bouning in new territories of Fancas. The result in this case was that the Floner died, the Frizor boun diedleaving Frizor as flat as the prairie on which it was built—and Morton county still does not produce heavily of fruit, corn, nor even the vegetables mentioned. The progress that has been made there in 42 years since had come about by a sanor, steedier growth in keeping with the meds of the people living in the community.

Farmer Political Movements Of The Times

One can find plenty of evidence that the Kansas press devoted adequate attention to the Grange, the Farmers' Alliances, and other farmer movements of the period. The Summer County Press of Wellington, the Oskaloosa Independent, the Sickle and Sheaf of Oskaloosa, the Ft. Scott Monitor, the Marion Record, and the Topeka Capital are perhaps typical of papers which most zealously guarded the interests of agriculture.

The Summer County Press took an active part in the fermer-labor campaign of 1875. Granting that fermers should organize and maintain their clubs, a writer who called himself "Fermer" said, in part (Oct. 16, 1875):

"They should exist in every county and township in this and other states. But I hold that the legitimate object of such organizations, is to secure an interchange of ideas, the discussion of agricultural and horticultural topics, the formation of cooperative societies for the introduction of improved breeds of stock, the purchase of supplies and agricultural implements; and lastly but not least, to discuss and criticize the acts of public officers,

and be ready to speak in unual scakable tones upon every public measure that may come before us; and more empecially those calculated to reach the pocketbook or entail a debt upon our properous new county." He consulted his article with the opinion that all classes—the mechanic, the lawyer, farmer, doctor, merchant—are indispensable and their intervate inseparable; that the best talent for public office should be placed in office whether that talent be doctor, lawyer, merchant, or former.

A week later (Oct. 25, 1873) the Press said editorially:

"We urge no objection upon the gentlemen who composed the convention. The majority of them were representative farmors, and largely identified with the agricultural interests of the county-man who are clear-headed enough to distinguish the demagogian that would blind them as to the true objects of egricultural organizations, and precipitate them into a class political movement. Hence, we believe they can have no faith in the success of a scheme planned solely with a view to much a consummation."

In the same issue the Press editor, having been secured of being unwilling to print political views not in second with his own, said in part:

"......" Is have opposed the so-delled Termora' Howement, becames we have considerationally believed it was insugarated by those who cered more for the spoils of the effice, than the true interest of the fermora.........." The editor also devoted a full column to the proceedings of the fermora' secures and the following week printed the resolutions, embodying the fermora' platform, as adopted by the fermora' meeting.

A week in tor (oot, 30, 1873) in the last issue before election and along with such other political meterial, e short item headed "A Word to Parmers" and wigned "Sykes," was printed. Sykes was a person who had travelled about the country, had found many fermors discouraged and wanting to sell their farms and go electbers. Sykes urged them to be strong in the face of deventry, urged them not to give up homes secured with so much toil and secrifice, urged them to stay on their farms because better time were coming. Five of the six candidates supported by the Press were elected and the sixth defeated by 16 votes.

The Press editor was not hostile to the Granevs. He asked the Granges-several had been organized-for their officers' names so they might be published and (Feb. 14, 1874) printed in its entirety a ons-column letter from a Grange member. Committees had been appointed, one with be duty of securing "the most advantageous terms for fetrons in trade." The writer explained in part:

"It is not the purpose of the patrons to stir up local realing; but it is presumable that they will trade where they will do best; so let Wellington be at least equal to her sister towns in this meter." In mentioning a big backet dinner fermore had held, the correspondent admitted that: "----though the farmore of the southwest are suffering many inconveniences, the patrons of Flessant Will have not only the necessities, but the luxuries of life."

From February to December, 1874, and in January, 1875, the Cummer County Press published a historical sketch of the county. Its agricultural resources were never omitted and the history was intended (Vol. II, No. 30) to be "a valuable saignetion document." The Ennace farmer found a sequent friend in the person of J. W. Boberts, founder (in 1860) of the Oskaloose Independent. His front page corried always the reminder that the Independent was "devoted to Agriculture, Mechanics, Arts, News and Comprel Literature."

In the early seventies (Vol. XI, No. 3, Sept. 10, 1870) in response to many requests, the Independent published s rolumn or more describing the Kanses elimete, soil, and its products, timber, water, fruits, minerels, stose, schools, churches, improvements, relironden-principally these things concerning Jofforcon county. While distinctly feverable to the sounty this description was not like many of the land-boom descriptions which the immigrant often received from Kanses. It was a conservative atatement of the county's resources. Roberts promised more of much descriptive material and it came inter in a series of long articles on the state's resources.

The Grenger morement was being organized around Oakslooss in the spring and summer of 1875. By Ostober the Crange hed a local organ in the Sickle and Sheaf, Wol. I, No. 1 of which was published by Jules L. williams, October 9 of that year. Even before that, however, the Independent editor was writing editorials as counsel to the

fermers. Those who prophosical the failure of the fermers' movement were wrong, he mainteined (June 21, 1873), provided the new party would steer shy of "the counsels of politicians, or permit political shysters to engineer their movement."

After reproducing both the cost and sales prices of sewing mechines and various farm implements to show that manufacturers were profiteering at the expense of the farmer, the editor dealared (July 5, 1873):

"That is \$497 profit on \$200 invested! Is it any sonder formers are poor while manufacturers are rich? It requires all the profits of the ferm to procure the machinery. A fair profit on the above would be \$100 or 50 per cent., at such prices, nearly every fermer could have his farm well provided with all modern improvements in machinery.

"Meform should be the watchword, and with it feir prices for all, the farmer, the menufacturer, the deeler." Continuing his self-assumed duty of being an outlook for the farmers, Editor Roberts (July 12, 1875) wrote:

"Our farmers friends will do well to notice very coreulty how many of the men who are active in Grenges and colubs presently begin to telk about office and figure around to accortain what may be their own chances for election. It is already prophesied that some men have gone into the farmers' movement with the determination to 'rule or ruin it; and if they cannot have things their own way they will do their best to breed discord and break up the organization. 'Forewarned is forearmed,' and if the farmers should keep both eyes open, and as soon as they discover a disposition on the part of any member of the Granges or clubs to run the institution in his own personal interest, or in the personal interest of some friend, to beware of his influence. If the movement is worth anything it is worth more than the advancement of any one person's interest, or any dozen men's preferences. Keep a warr ere on all political aspirants, and do not let them run the Grances, or any other farmers' organization, for selfish purposes: but be sure that good men, honest and well qualified, are selected to fill all the offices."

More than a year later (Nov. 14, 1874) the Independent recorded an aditorial charging that the Granges had become more political societies. The editorial lambasted members of the organizations for allowing that condition to devel-

When the Siekle and Sheaf appeared in October its prospectus declared in part (Oct. 9, 1875):

"--- They (men) are led to do this by the almost in-

stinctive feeling that organization and concentration of effort give strength.

"Thile all other professions and occupations have thus seemed harmony of purpose and unity of cetton in seeking after their welfare the Agricultural portion of our community has been, until recently, without organimation of any kind. The need of such organization has long been relt by the fermers of the country.

"To supply that want the 'Order of the Petrons of Busbandry' was instituted. Of comparatively recent growth, this Society has spread into nearly all the Western States and territories. In Kanses they number thousends, in Jefforson county the majority of the rural population are members of the Order. Such a large body of intelligent people need an organ which shall be the exomest of their views, which shall advocate their claims, and which shall diffuse among them such information as will smalle them to investigate for themselves the questions of the day which are being discussed, and to comprehend the ends at which they aim. The demand is for a paper that shall do this, and at the same time, being published at home, contain the local, county, and state news. To neet this demand the SIGGLE and SHALF is established.

"It will be the organ of no political party, but will

assume the ground that all political action should tend to scouring the rights of the people, that all somepolies are dangerous, and that the same concessy and uniteres test should be brought to bear upon governmental affeirs that man exhibit in the management of their our concerns.

"The paper stands pladged to free discussion of every question which concerns the prosperity of the country. The work of reform belongs to all honest men, of whatever rank in life, let them work together and not against each ather.

"To that end the columns of this paper will always be open to correspondence upon the topics of the day. Correspondents to be responsible for their own views."

The Sickle and Sheef rowained atsections in its announced intention to give attention to agriculture. It had much to print about a cheese factory (lost, 18, 1878, July 4, 1874) which its editor thought would be a blessing to the community because it would diwrenify the agriculture. He was opposed to inflation of the ourremay (Apr. 25, 1874) and in the same issue there eppeared nine columns of delinquent tax lists.

The gradual decline of the Gronge in Kaness may be seen in the following item reprinted in the Blue Rapids Times (July 26, 1877): The rapid dealine of the Granger Novement has been moted. The St. Rull Press says the last ensual report, which was kept secret for a good while, has at last seen the light, and according to this document over 9,000 local Granges that existed in 1875 had some out of existence in 1876, and the membership reduced more than 189,000."--Chi-

The Margarille Signal (Oct. 20, 1881) carried an article on the second ennual meeting of the Fermers' Alliance in Chicago. There were then 245 Alliances in Innass, more than in any other state excepting Mebruska, which had sel.

eago Journal of Commerce.

Hight years later the Topeka Deily Capital (Dec. 15, 1889) printed the information that there were them 1,200 alliances in Ennes with a membership of more than 70,000 and increasing at the rate of 2,000 per month. Growth during 1889 had been rapid in Kanses. The Capital outlined in a news story the plans of the Alliance to get for fermers more money for their crops. The conditions existing were large crops, low farm prices, but high prices on commodities purchased by farmers. The Capital reported the failure of two banks. The Alliance was in session in Topeka at the time.

A week later (Dec. 18, 1889) with the state Grange in

annual meeting of Topeke, the Coffel printed on editorial on the importance of agriculture, the dependence of others on it, and the fermers' consequent right to expect and demand a fair return for their labors. The closing paragraph of the article shows how Tannas papers were encouraging agriculture in its struggles:

"The framers are all sware of these things and do not set to be told of their existence but how to get rid on them (combines, trusts, etc.). By combination. Combination to study conditions and remedies, to present an organized body or bodies of men whom capitalists and legislatures must respect and demagagues cannot deceive, to exect an influence for the good of expiculture, which is the good of all, is where the farmer must seek the means of improving his condition. The Grange and the Allience get the farmers together where they may compere notes and communit for the future. Such organization was never no necessary and popular as now. Farmers justly feel that compthing is wrong and that they must have a share in righting it."

The ther the Orange and the Alliance accomplished the immediate needs or not, such newspaper somment from many Ennems papers could not have hindered them in their work. In the next column the Cepital published another editorial on the bed plight of fermers in Pennsylvania and another on ferm land values.

The Capital carried each day (Dec. 15, 10, 20, 1889) a detalled news story of the Grange meetings. It printed the Openias aspech of the Grand Master, printed resolutions and similar material, thus laying before its readers the opinious and platforms of the state and mational Grange.

In the autumn of 1889 (betw. Norw, and less) the capital also produced much news and comment on the beef court-which me being investigated them. The Onyital opposed the combine in the interests of Emmass cattle men and urged them (Dec. 15, 1889) to cling to the industry, insmuch as the United States sentorial investigations committee secmed about to "break" the combine. Moreover, enormous numbers of cattle had been out on the warkst, depleting the supply, and ranches in the Indian strip of Oklahusa had been ordered to clear their beds out of that country. It seemed than that cattle prices were certain to improve.

Another instance in which the Kanama press demonstrated its willingness and ability to guard the interests of Lansas agriculture occurred in the late eighties. Old settlers will recall the troubles that grew out of the sugar anking industry in the state at this time. The Marion Becord, Ft. Scott Monitor, Topeke Cepital and other papers scaloualy guarded the interests of Kansas people against fraud in the establishment of come sugar featories. The scheme of the promoters was to import sugar, represent it as made of Kansas cane conglum (showing the possibilities of the industry), and then to sell stock in local companies which were doomed to failure.

It should be mentioned in passing that the Concordia Seekly Times and the Concordia Empire devoted much attention to agricultural problems of this decade.

AGRICULTURE AND THE PRESS FROM 1890 TO 1900

Changes in the type of egricultural news printed in Kansas during the period covered by this study are sometimes difficult to determine, especially any changes between one of the shorter periods discussed and the period following. For instance, differences in the agriculture of the state in the decade immediately following the war and the period from 1870 to 1890 are not always classraut. However, to compare the last decade of the aimsteacht century with the period before the war or immediately after the war—that is a different situation. The periods contrast as black and white.

Knames was no longer a pioneer state in 1990, har agriculture was firmly astablished. Her farm people had lived a generation on their homesteeds and, despits many years of hard times, had created happy homes on every tilleble section of land within her borders.

Similar changes had been brought about in newspeper offices of the state. The boom editor with his "shirt tell full" of type had given may to the conservative editor whose purpose he binself believed was to carm a respectable living for himself and family and to serve his community.

In the last quarter of the mineteenth century no less attention was given to production of farm stops but more attention was devoted to selling at a profit the crops that were produced. This naturally involved the farmers' interests in politics through cooperative enterprises, the Grungs, Tamurs' Alliences, and such movements. Cureful farmers placed more stress on diversified agriculture, having learned it is a dangerous policy to "carry all one's eggs in one backst." With gradually improving conditions farmers could afford to devote more attention to minimizing the druggery and isolation of rurel life. Farmers' institutes joined the newspaper and the farm papers and other agencies in promoting a better agriculture.

## An Agricultural Awakening

The period them from 1800 to the end of the century was one of agricultural awakening in Kanasa. Hany of the farming principles and precitice first advocated during the decade have been adopted and form now a part or parts of recognized agricultural methods. The following references to newspapers of the period are presented to show the part played by the Kanasa press in usbering in this new era in the state's agriculture.

The Ft. Soott Daily Tribune, that Bourbon county newspaper that has done so much for agriculture in its
community, printed (July 6, 1897) a forward looking editorial typical of a spirit of the decade which urged from
people to pay greater attention to overcoming the drudgery
and isolation experienced by Kansas formers in earlier
years. The editorial dealt uit he electrical power on the
farm and possibly was written by its present able editor.
George W. Murble, who then we its city editor. The
writer of the editorial was able to look into the future
of elsetricity on the form. Parts of the comment—the
first found in reference to Kansas agriculture and elsetricity—Color:

"That the well to do twentieth century firmer will be able to do almost everywhere has been shown on a large country place in Germany. All operations requiring power, amount those of actual tillage of the soil, are performed by means of an electric plant run by the fall of water-----(The materful was constructed in a brook on the farm.)

"----The house and all out buildings, as sloo the laws and grounds, are brilliantly lighted by electricity. The current does not as yet seem to have been utilized for beating purposes, though it probably could be."

Much of the Libor saving medinery and many devices for convenience on the form referred to here have since some into common usage. They have not come only because the Ft. Scott Tribums printed this one editorial but because many another newspaper and magazine printed similar articles. Such articles carried to agriculture the latest information on the progress of electricity—its efficiency, its abortoonings, its best uses, its dangers, and information conserving many other phases of its possible utility. By reading this information people learned new things, see may possibilities in their own form life and business, found new encouragement in electrical power.

This reference to electricity is only typical-the same conditions apply to steam power, to the gasoline engine, and to coorse of ferm implements and devices. As the printed newspeper page today carries the latest information concerning the automobile, the radio, the simplane, just so did it take to Kaness farm people during the last decede of the mineteenth century the surrent findings of the industry.

In the next issue of the Tribune (July 7, 1897) there appeared a splendid editorial maintaining that farmers should plant trees systematically on each farm. Such a prectice had then and has since proved to be a good investment from a cash standpoint. The Tribune argued the planting of trees would be one of the very best farm investments.

# A Journalistie Awaksning, Too

A better brand of journalism was unbared into Kammas newspapers during the decade, 1890 to 1900. Agricultural cases was reported in more detail and with greater sources. Hesspapers tracted agricultural events in news stories and reserved personal opinions for the editorial page, instead of combining the two in one and thus discentianting biased atories which were characteristic of carrier Enness journalism.

For example, in the Hutchinson News (April 1, 1890)

there appeared a news story concerning a meeting of sugar growers, meeting to organize the Kansas Sugar Growers' Association. The story included resolutions effecting the organization. The following faume (April 2, 1890) contained an editorial and a news story about the sugar growers' meeting. Radi was an effort on the part of the paper to help the sugar men to an understanding of their scallens.

In its issue of April S (1880) the News devoted four columns to the doings of the sugar govers who had organized the Kanses Sugar Association. The stories dealing with the sugarmen's meetings included resolutions, the constitution adopted, speeches, and letters.

Deet sugar for Kaness was a new thing then but it was recommended that it would be a vise move to begin experimental study of best sugar outure. The sugarment desired a government experiment station to study also the best varieties of sugar cane. The News and other papers belied the sugar growere to become articulate concerning their autual problems.

In the Mutchimson News (April 5, 1890) there appeared an aditorial analyzing and oncouraging the silk industry for Lansas, once thought likely to become one of the major industries of the commonweith. The closing peragraph "Of course mobody supposes that Kaness will throw aside all her other industries and go into the business of reising silk ecocome, but it is reasonable to expect, owing to the adaptability of the climate and the ease with which Osage and milberry trees may be grown, that this will become a valuable suxiliary to other farming interests."

### The Dairy Cow Comes To Kansas

The Ablene Delly Reflector (April 3 and 4, 1890) helped maintain the reputation of mineteenth contury Kances pepers of giving ample space to farmers' meetings. A meeting of the state dairymen's association was being held in Ablene and the Reflector devoted three and four columns daily to the proceedings of the convention. It said editorially:

"The State Dairy Association which has become Abilone with the first session of its existence under its new form brings to our city many re-recentative men in the dairy field. Kansas has taken long steps forward in the direction of manufacture of dairy products during the past two years. Her farmers have begun to see how a diversified agriculture, with its accompanying benefits of regular revenue, can aid then to a less spoulative existence. In no county of the otate has a greater mocese been made of dairying than in Diokenson. Our numerous areamerice when properly managed have proved profitable and their products become widely known. For this reason, as well as out of regard for our visitors, the members of the dairy association from abroad will be reloamed. The prestical hints given regarding modern methods and processes will be valued by our farmers and furners' wives."

Among the things urged by the dairymen in their conference and reported in the Heflester were:

(1) Improvement of dairy cors--cholishment of the sarub cow. (2) Proper care of cream--good cream, good butter. (3) Greater use of the cilo in Kensas. (4) That more mortgares on Kanses forms be paid off by the cow and the hose.

It must be a pleasant recollection to some of the older Kansas fermors who attended these meetings to survey the norrly four decedes since and realize at least partial fulfilment of virtually all their hopes.

Further evidence of the extent to which papers of the decode were publishing agricultural material is an illustrated criticle on building a now barm and eilo in the Compordia Tamann (May 10, 1808). The article was reprinted

from the Country Centleman. The Kensen printed many other agricultural peragraphs and short erticles.

One of the interesting form columns developed during the decends was that of the weekly Winfield Courier (March 50, April 6 and 15, 1999). Its boxed beading was attractive:

The author of the column, being a suresymman, wrote much of fruit trees and flowers, but his ideas on planting trees—what and when and how-were interesting and of immensurable value to farmer readers as well as "town folks." In one article, hiertin explained the care needed by trees which had been uprooted for transplanting, why they conctimes fulled to grow, and hoe formers could handle them best.

Some subjects discussed at various times by Martin (spring of 1899): Trimning fruit trees, how to protect garden plants from frost, formulae for spraying trees and garden truck, how to raise chickens free from lice. The directions for the latter were to put one complorated ball in each laying and setting hen's neet after which no mites sor lies would bother.

# Alfalfa Makes Its Appearance

In his history of Kunnes Connelly has estd the introduction of grain sorphuns and alfalfa in the nineties marked an era of development and prosperity for Kanses farmers. In the Courier (May 11, 1609) Martin devoted considerable space to elfalfa, claiming it to be a crop that would take the place of wheat as a cash crop in Kanmass. This was the criticst reference to elfalfa found in this study, although the legume was used in the state massiv a decembe exciter.

Martin referred to some electife that had been planted eight years previously and to some which had been planted for five years. In each case the crop had given several extings each year with no cultivation—only the expense of harresting. He asked farmers to figure for themselves whether alfalfa or wheat was the most paying crop. Martin had some mistaken ideas upon the maybeet, as the last three decades have developed new knowledge concerning alfalfa. He expected it to be left to grow for many years, whereas time has demonstrated that it is best to use alfalfa only a very few years in a well planted crop rotation.

In urging farmers to plant alfalfa, Martin cautioned them to "remember your soil is becoming exhausted and may not endure another twenty years of like severe cropping.

"And when after twenty years the coll is again broken it will be richer in all of the constituents or plant food with the additional value or being well subsciled by the deep roots of the affalfs."

Martin felt that alfalfa, once a stand was obtained, would be left for as long as 20 years. To some extent at least, he was led to believe this because of his argument that the crop, being perennial, avoided the annual expense of purchasing seed, preparing the seadbed, and planting. He calculated a stand could be obtained with only one planting which was alightly more expensive than one planting of wheat but which would sorve for many years. He figured the value of alfalfa hay at three times prairie hay or \$6 per ton, and with three tons per eare per season, the value of the orop he figured was about \$18 per

Martin may have been missisted in some of his theories regarding alfalfu but he must certainly have got immense results through his advocacy of the legume in Kanses. The Courier enabled him to speak to bundreds or perhaps thousands where otherwise he would have passed along his ideas only by occasional conversation, letter, or public address.

Martin did not confine binnealf to erops entirely. In an editorial (May 169, 1699) he reminded his readers that knowledge is power, urged furners to read more, study nove, and to do their best to give their children an education.

Immunerable instances such as those cited here could be referred to as evidence of the so-called agricultural awakening and the better brand of journalism which came with the decade. But the few examples reproduced in part or in full will serve to illustrate what was typical of the agricultural nows and comment of the Kansas press.

Kansas had in less than half a century been changed from a wilderness to a progressive, prosporing commonwealth. Her agriculture had become well established, her towns were stable. Her government was stable. Horeover, her newspapers had kept poce with her other industries.

newspapers were established and provided their renders each day with news of the world, with market reports, as well as with local news. For smaller towns, weekly newspapers did as much, specializing more in news of the local community. Because Kansos was primarily an agricultural state, her newspapers printed material bearing upon this all important industry. That it was of a character which made it useful and important to a majority of the state's population already has been shown.

### SUBDIARY AND CONCLUSIONS

In summarizing the results of this study—the purpose of which was to determine how the press helped develop Kamens agriculture—two facts stand out electly. The study has shown, first, that newspapers came to Kamens with the earliest of white set there after the region was designated kamens territory. Whenever a new Kamens town was organized, a new Kamens paper was born. Second, because the founders of the town were invariably depending upon the agriculture of the community to prosper them, the newspapers as invariably printed material which enhanced the agricultural possibilities of the immediate wichnity.

Greating then that newspapers existed in every important community center of Kansas during the period 1854 to 1900 and that they printed muon egricultural material, it remained to be determined whether this material was beneficial or heraful to the state's most important industryagriculture.

It is evident from the tone of virtually every reference cited that the editors printed the agricultural material with one purpose in mind-that of aiding the industry. In the earliest newspapers, Enness editors bragged of the wanderful agricultural possibilities of the state. Their eriteles of preise brought thousands to the new rest to build their homes. Their coming heatened cultivation of the state's fertile soil.

Almost as soon as the earliest settlers had picked their claims, newspapers were printing ideas concerning erop varieties, giving their readers the benefits of other furmers' experiences, telling for the benefit of all the value of planting trees, seaming along cooking reeipes, says of making soop, tips on marketing products grown by the early farmers, urging the citizens to help obtain reliroids for their particular locality. These things were done by the newspaper editors to make their respective communities and the state as a whole a better place to live.

Occasionally there is evidence that a newspaper hind-

ered intelligent development of egriculture. The instance of the Frisco Pioneer was cited as a case where too much land boundag was done by the local paper. But eases such as this are not numerous. Moreover, it might be argued that the Frisco Pioneer only hastened the ultimate demice of Frisco, founded unfortunately before the world was ready for it.

### A Great Reonomie Error

The entire notion was at fault in the period following the Civil war, up to 1900, in emecuraging agricultural expansion beyond the meds of the market. Now land was brought under the plow before it was needed with the result that many settlers lost their entire fortures. During this period mortgages on Emmac lands were in considerable disrepute in the east, a reputation that was not entirely overcome until well within the present contary and perhaps not wholly until the passage of the Federal Fara Loan Act. This situation was the result of a mistaken policy on the part of the entire action. It seems that the chitors of Kaness of this period should assume a where of the responsibility for this gross cocmands error. So far as the editors are concerned, it was a mistake of omission as much as, or more so than, one of soundssion.

It is established, then, that the newspapers were present in the state, their editors were willing to print such information as sould be helpful to Kanusa agriculture, and the unterial which was printed was the product of the state's best agriculturists. The last statement is true because must of the state's editors were well educated, had here minds and common sense enough to snalyse most problems. It is true also because much of the agricultural material was submitted by experienced formers—men sho studied their woostion as a science.

The newspapers, by their very meture, were from the beginning and are now in a position to pass along inforaction of pructical value to formers. The attaction is sell stated in an editorial appearing recently in the finnespolis (Minn.) Tribune. The editorial in pert follows:

"A rather striking expression of opinion was that....
to the effect that the newspopers of the country. Are
unblishing statistics and information of value to ferrore,
have done here then cay other areasy to aprend the Gottrine
and establish the habit of nound carforditural methods....

"The Tribune has always been free to acknowledge the

port the agricultural colleges have played in extending applied solenes from school room and experimental tract to the farms of the land. The corrice thus rendered has been incolculably great, and it has grown greater in very recent years under the compulsion of economic alreumstances that have affected the farm industry. Educational institutions, publichers, transportation officials, urban financiers, and governmental agencies have carried on a concerted work as never before to raise the efficiency of the farm plant. By their very nature the newspapers have provided the chief contact between those who have nowsthing of value to tall the farmer, and the farmers thereelves.

"...... The farmer owes to his newspaper the fact that he is getting today a liberal education in serionltural economics and research without leaving his decreter'."

This situation is not essentially different that it has been since the founding of the first newspapers in Kansas. Before the coming of agricultural experiment stations and other agencies which sided exciculture, there was no much information and valuable scientific data evailable as there is today. But eareful, observing, thoughtful farmers provided editors with helpful ideas on excitculture which the latter published for the benefit of others.

Moreover, before the Civil war was over a state agri-

cultural society had been organized. Simitmeounly county agricultural societies were being founded, local fairs were started, and commissed farmors' meetings were making available portain valuable and important information on agricultural subjects. Then and at all times since, the press of Kansaca has pressed this information slong to its readers, making them, as the foregoing reference states it, "the shief contact between those who have something of value to tell the farmor, and the framers themselves."

### Newspapers Minimized Isolation

Nothing has yet been said to stress the important part assapepers have played in simply bringing into rural homes mers of the neighborhood end of the world. Farm persons are like other human beinge—they sent to know what the world about them is doing. In the early period of the state's settlement, when loneliness was a more vital factor than it is on Lansas forms today, this learning of the world news through the press was unquestionably a more important fractor than at present. Today, the automabile, the telephone, and the redio have greatly reduced the isolation of the individual form. But during the period covered by this study, the press certainly had no close rival as a certain or ordin news events.

Another principal vervice done by the press of Eness was the presentation of both sides of volitical and social differences. In times of political unrest, such as during the populat movement in the nineties, the prose always presented both sides of the controversy, thus helping the votere to an understanding of their problems. The presentation of both sides of any controversial matter was assured because on no question do all persons agree—least of all perhaps, newspaper editors.

Neither is any reference made to the type and effect of newspeper advertising printed during the period studied. Advertising was not used then as now, was not the powerful factor in business that it has become in the twentieth century.

A volume could be written on the Kannes press and the railreads—the former never failed to promote the building of the railways into all corners of the state, though aditors frequently soutloned their people to temper their railread building with sound judgment. In the early days Kanness people often jumped bendlong into bond issues to guarantee the coming of railreads, then paid later for their leak of foresight as they blamed the railreads for hard times.

likemise a volume could be written of the press and its sid to the sevice board of agriculture, to the Kansas State Agriculturel College, and to the United States Department of Agriculture. In each each the newspaper has been one of the best agents, if not the best, for transferring fronts and information from these public institutions to the agricultural popule of the state.

Teresence noted in this study show that the press heartly comperated with these institutions in discenimating valuable agricultural information. These rous instances were noted where the otate board of agricultural experiment station, and the United States Department of Agriculture were publicized. The greatest development of this publicity has come in the twentieth century, which is not included in the study.

As a final conclusion, the results of this study show beyond all shedow of doubt that the newspapermen of Eansas have been a vital factor in the development of the state's agriculture. They have given liberally of the space within their columns, they have grinted always what seemed to them to be the most important and valueble information available upon agricultural topics. The publication of this infor-

91

mation has kept the Konses fare copulation well informed at all times, and thus has contributed immedsurably to its material, spiritual, and social wealth.
